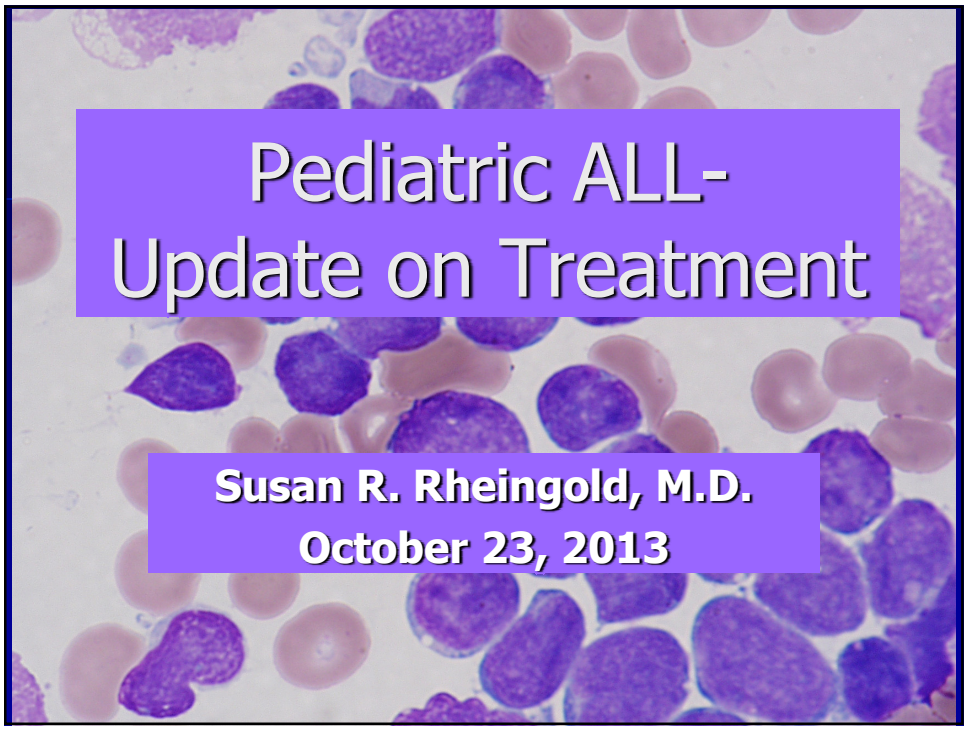
Pediatric ALL

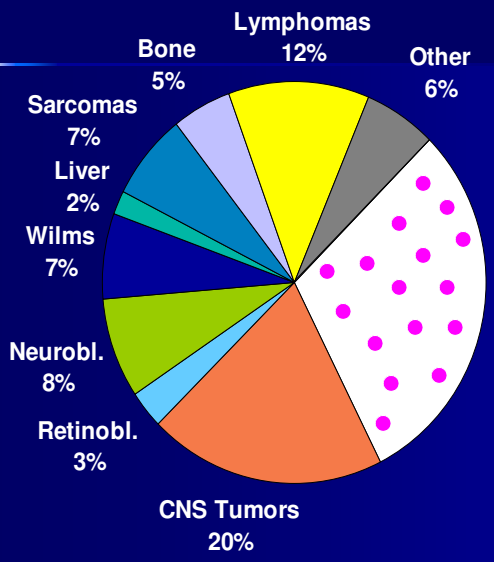
Update on Treatment and Follow-Up Care

someday is today | LEUKEMIA & LYMPHOMA SOCIETY® fighting blood cancers

Welcome & Introductions



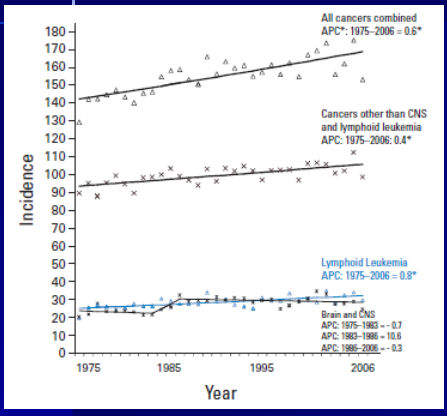
Types of Childhood Cancer

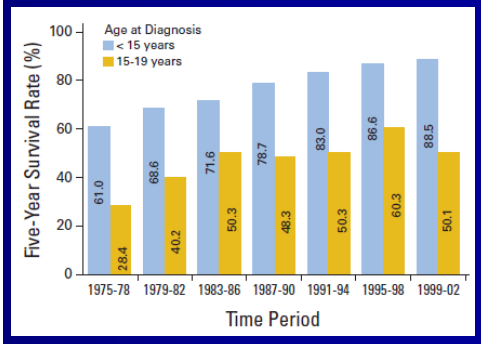


LEUKEMIA 30%
(25% ALL)

~2,500 children/yr diagnosed with ALL and rising

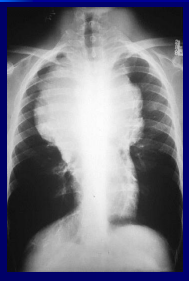
ALL Incidence and EFS

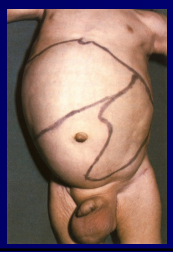


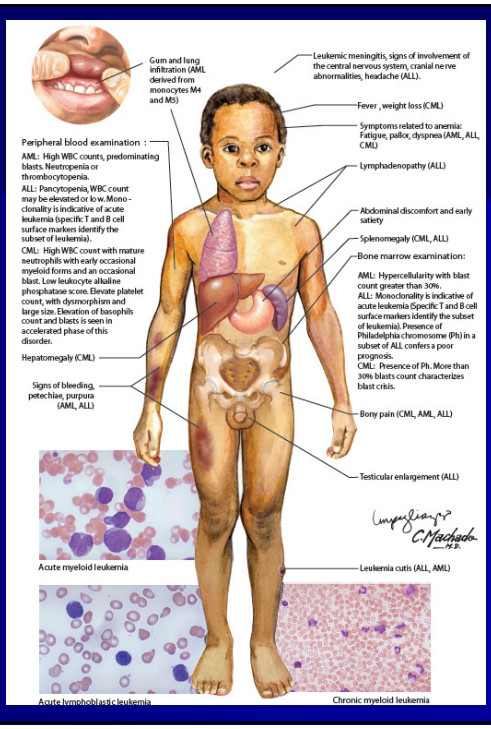


Smith MA et al. JCO May 2010

Clinical Presentation of ALL







Diagnostic Procedures

- BM Aspirate & Biopsy
  - Morphology
  - Immunohistochemistry / Flow Cytometry
  - Cytogenetics
  - Microarray (SNP)
  - Biology studies
- Spinal Tap – CNS 1 (no leukemia)
  - CNS 2 (minimal leukemia)
  - CNS 3 (lots of leukemia)

NCI/Rome Risk Classification for ALL

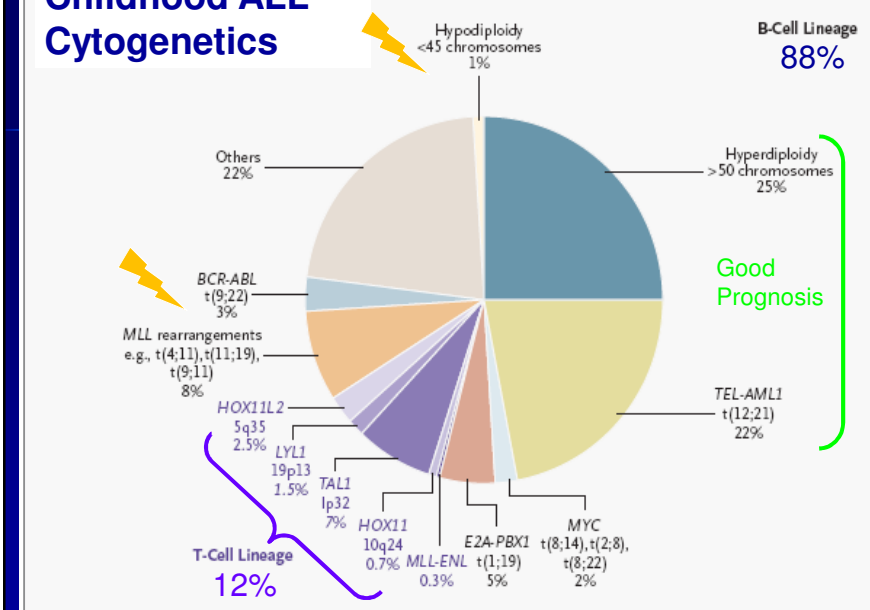
Age	WBC < 50,000/µl	WBC ≥ 50,000/µl
< 1 year	Infants (3%)	
1-10 years	Standard risk (58%)	
≥ 10 years		High risk (39%)

Immunophenotyping / Flow

Table 2. Common Markers Used in Flow Cytometric Immunophenotyping[a]

Antigen	Myelo-blasts	Promyelo-cytes	Maturing Grans	Mono-cytes	Erythroids	Megakar-yocytes	B Lym-phoid	T Lym-phoid	Comments
CD2	–	–	–	–	–	–	–	+	LFA-2; pan T-cell marker
CD3	–	–	–	–	–	–	–	+	OKT3; pan T-cell marker
CD4	–	–	–	–	–	–	–	Sub[b]	MHC-II associated; helper T cells
CD5	–	–	–	–	–	–	–	+	Leu-1; pan T-cell marker
CD7	–	–	–	–	–	–	–	+	Leu-9; pan T-cell marker
CD8	–	–	–	–	–	–	–	Sub	MHC-I associated; cytotoxic T cells
CD19	–	–	–	–	–	–	+	–	Leu-12; pan B-cell marker
CD20	–	–	–	–	–	–	+		L26; B-cell marker
CD22	–	–	–	–	–	–	+	–	BL-CAM; pan B-cell marker
CD79a	–	–	–	–	–	–	+	–	MB-1; pan B-cell marker
CD13	+	+	+	+	–	–	–	–	Aminopeptidase N; pan myeloid marker
CD14	–	–	+	++	–	–		–	LPS receptor; bright on monocytes
CD15	–	+	+	–	–	–	–	–	LeuM1; maturing granulocytes
CD33	+	+	+	++	+	–	–	–	Sialic acid adhesion molecule; pan myeloid marker
CD36	–	–	–	+	+	+	–	–	GP IIb/IV
CD117	+	+	–	–	+	–	–	–	c-kit; bright on mast cells
CD64	–	–	+	+	–	–	–	–	FC-γ receptor
MPO	Sub	+	+	–/+	–	–	–	–	Myeloperoxidase; definitive myeloid marker
CD71	–	–	–	–	++	–	–	–	Transferrin receptor; dim expression on activated cells
GlyA	–	–	–	–	++	–	–	–	CD235a; carries MN antigens on red cells
CD41	–	–	–	–	–	+	–	–	GP IIb; megakaryocytic
CD61	–	–	–	–	–	+		–	GP IIIa; megakaryocytic
CD10	–	–	+	–	–	–	Sub	–	CALLA, also expressed by hematogones
CD38	+	Var[c]	Var	+	–	–	Var	Var	Broadly expressed
CD45	+	+	+	+	–	+	+	+	Leukocyte common antigen
HLA-DR	+	–	–	+	–	–	+	–	Class II MHC component
CD34	+	–	–	–	–	–	Sub	–	Adhesion molecule; marker of immature cells
TdT	–	–	–	–	–	–	Sub	–	Nucleotide transferase; marker of immature cells

Childhood ALL Cytogenetics



Pui, NEJM 2004

Microarray/SNP

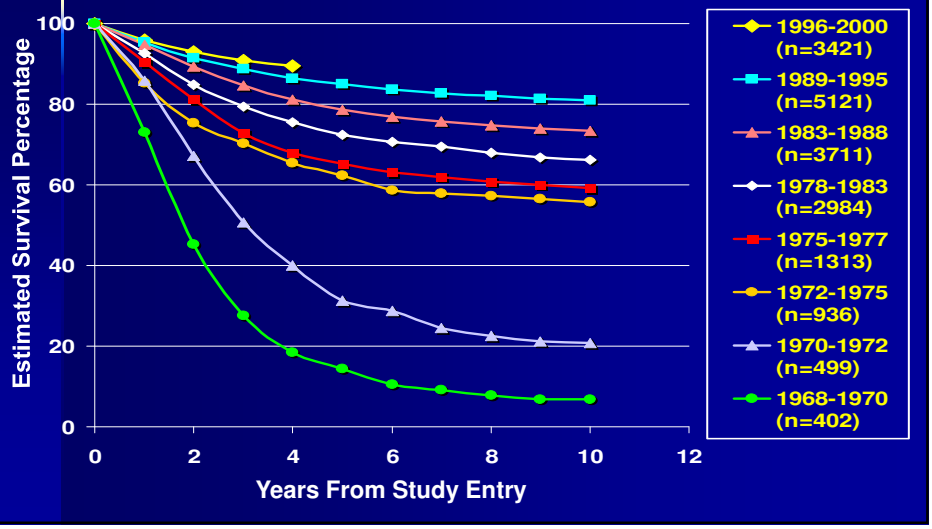
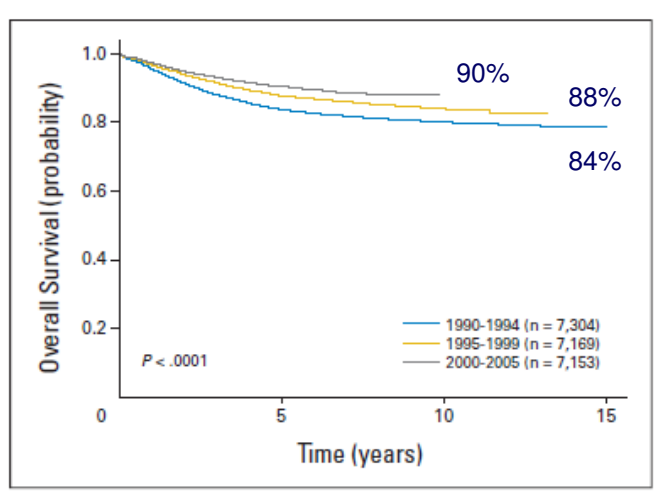
Why do Clinical Trials? (COG ALL trial outcome)

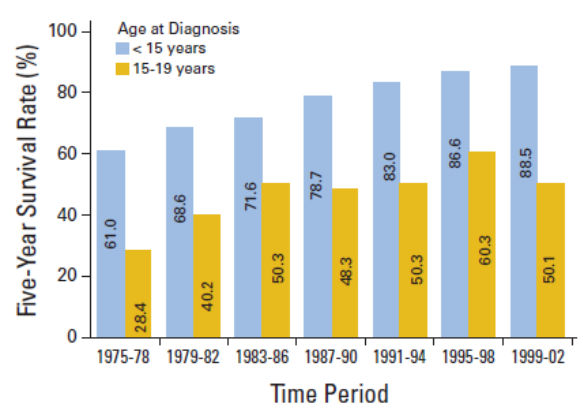


How far have we come?
COG 5yr EFS



Hunger SP et al. JCO May 2012

Why aren't the 15-21 year olds doing better?



Best Therapy for Adolescents (15-21 years)

Table 1. Retrospective data for AYAs treated on representative pediatric or adult ALL protocols

Trial	Pediatric	Adult
FRALLE-93/LALA-94[28]	5-y EFS: 67%	5-y EFS: 41%
CALGB/CCG[34]	7-y EFS: 63%	7-y EFS: 34%
MRC ALL 97-99/UKALLXII-E2993[29]	5-y EFS: 65%	5-y EFS: 49%
GIMEMA/AIEOP[30]	2-y OS: 80%	2-y OS: 71%
HOVON/DCOG[31]	5-y EFS: 71%	5-y EFS: 38%
Adult ALL Grp/NOPHO-92[32]	5-y OS: 74%	5-y OS: 39%
Finnish Leukemia/NOPHO[33]	5-y OS: 67%	5-y OS: 60%

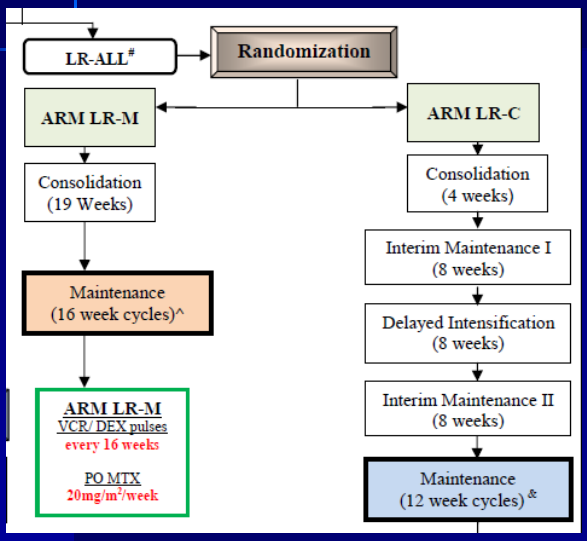
Last COG Trial
> 16 years – 79% 5yr EFS

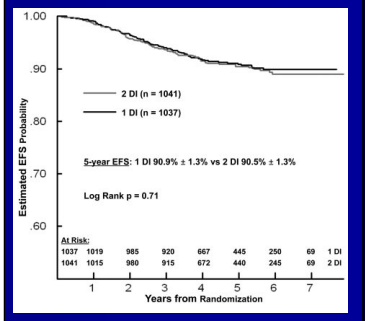
Wood, W. Blood 2011

What do Clinical Trials for ALL Ask?

1) Reduction in Therapy Questions:
   Decrease toxicity and late effects
2) "Re-arranging the Deck Chairs":
   Varying the drug, dose, order
3) Introducing New Agents:
   Higher cure rates?
   Toxicity / Tolerability

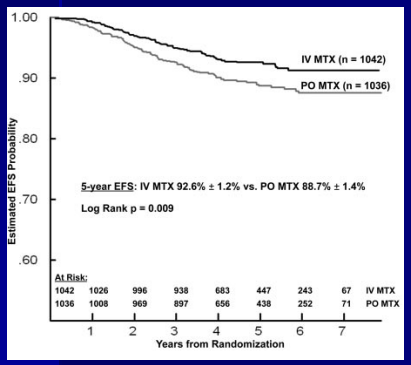
Reduction in Therapy

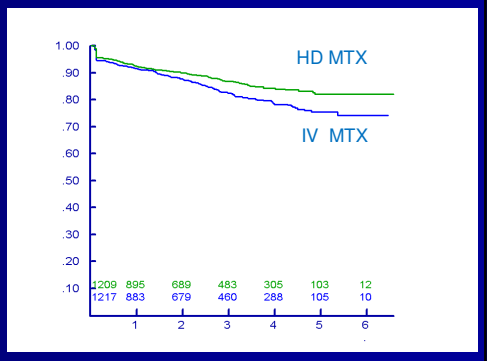




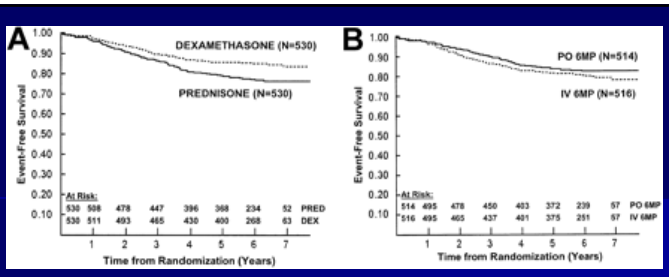
Changing Drug or Dose

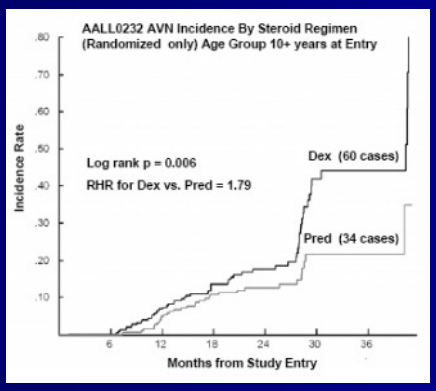
What is the best way to give Methotrexate?





AALL0232





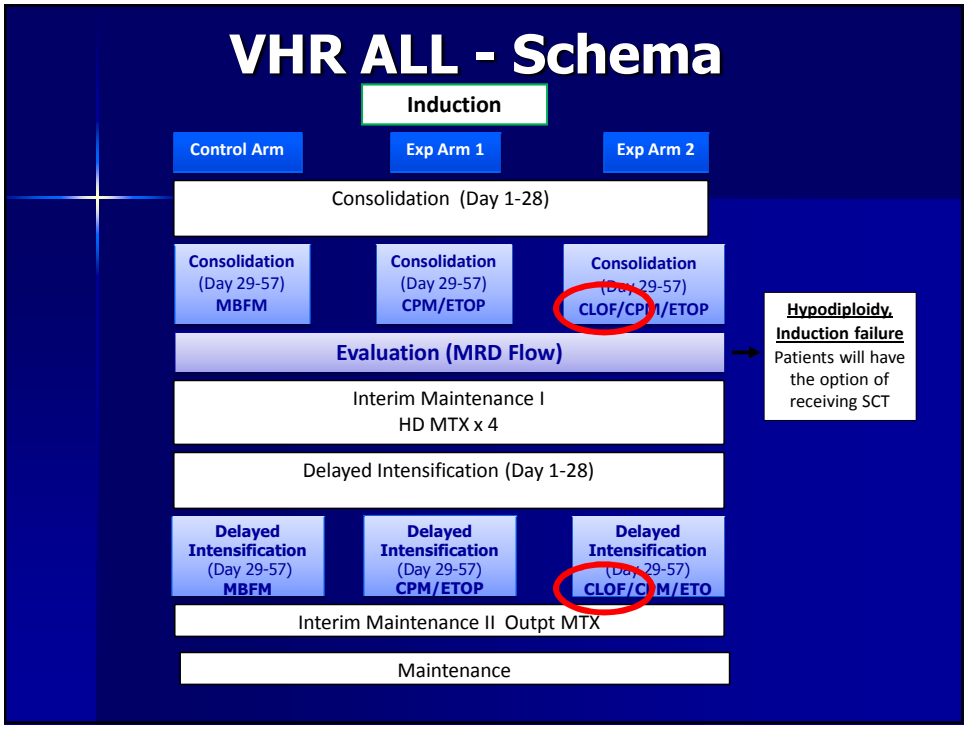
Dex x 14 days for ≤ 10 years

Pred x 28 days for > 10 years

AALL0232

Adding New Agents

- Newer chemotherapy agents
  - Clofarabine
  - Nelarabine - T cell targeted drug
- Targeted agents
  - Imatinib/Dasatinib
  - Lestaurtinib for MLL
- Immunotherapy
  - Monoclonal Antibodies
  - Engineered T-cells



VHR ALL - Schema
Induction
Control Arm
Exp Arm 1
Exp Arm 2
Consolidation (Day 1-28)

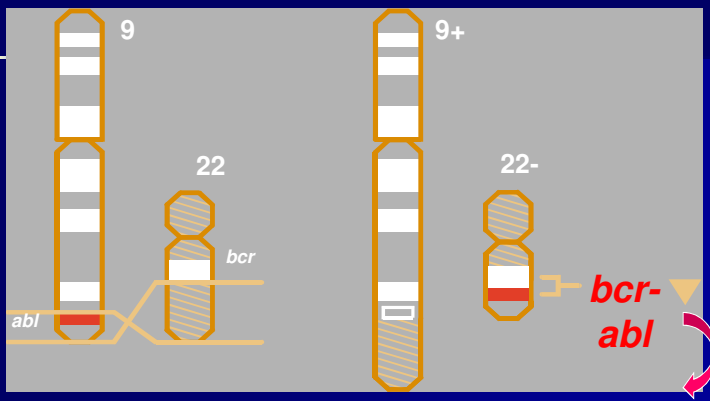
The first molecularly targeted drug



Fusion Protein with Tyrosine Kinase Activity

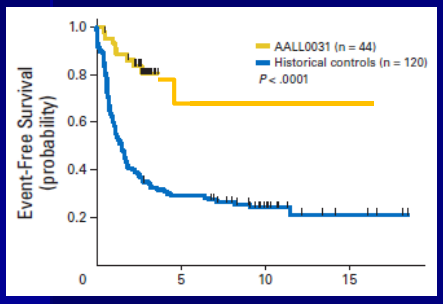
Upregulate DNA, Proliferation

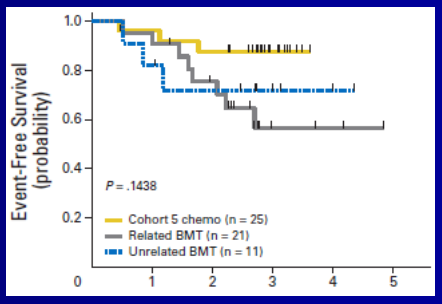
Faderl S et al. *Oncology (Huntingt).*

LLS funded research

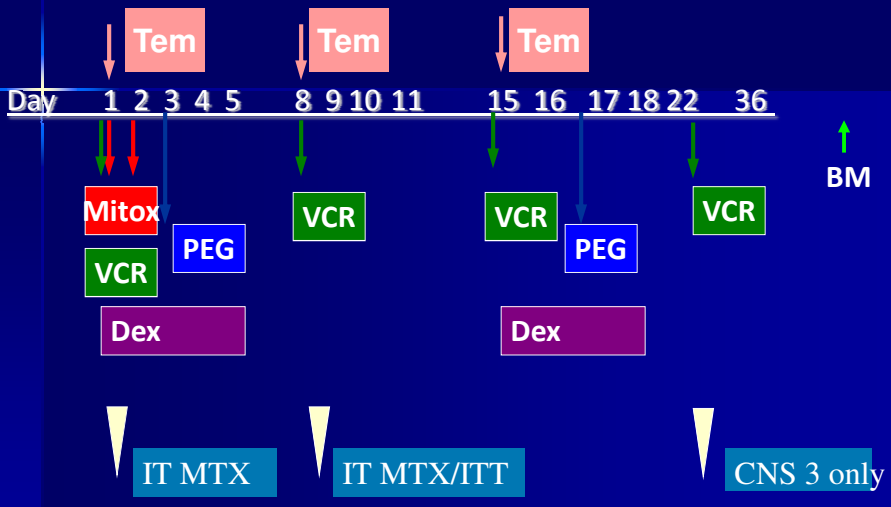
Targeted Therapy: the way of the future

Adding a single drug, Imatinib, to chemotherapy increased survival from 30% to 70%





ADVL1114: Temsirolimus

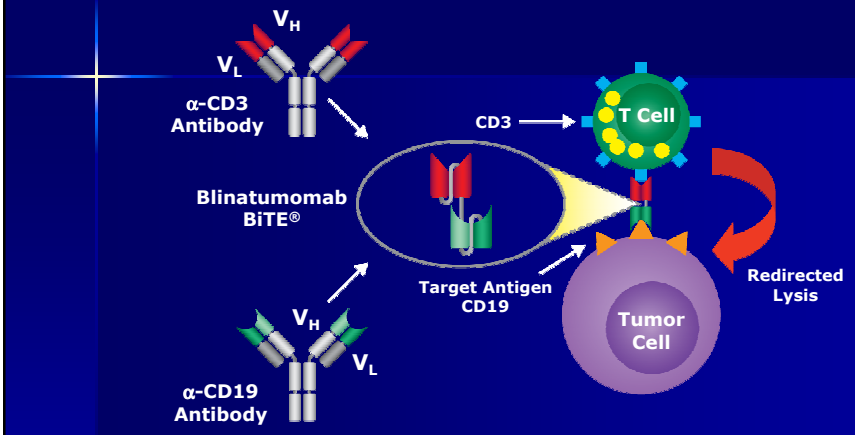


LLS funded research

Monoclonal Antibodies:
Targeting specific cancer proteins

Agent	Mechanism of Action	Target
Rituximab	antibody to CD-20	B-ALL
Epratuzamab	antibody to CD-22	B-ALL
Alemtuzumab	antibody to CD-52	B & T-ALL
Combotox	antibody to CD-19 & 22	B-ALL
Blinatumomab	Attach patient CD3 T-cells to CD19	B-ALL
Moxetumomab	antibody to CD-22	B-ALL
Inotuzumab	antibody to CD-22	B-ALL

Mode of Action of BiTE® Antibody Blinatumomab



- Blinatumomab (MT103) is a Bispecific T-cell Engager (BiTE®) antibody designed to direct cytotoxic T-cells to CD19 expressing cancer cells

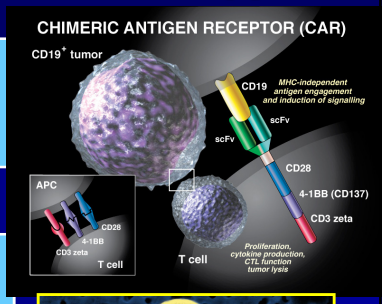
Bargou R., et al. *Science* 2008;321(5891):974-977.

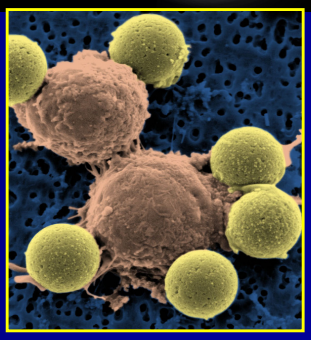
What is CART-19 (CTL019) Immunotherapy?

Immunotherapy reprograms a patient's own immune system to better fight cancer.

T cells are workhorses of the immune system. They recognize cells that don't belong and attack them. However, T cells are blind to cancer cells, which fly under the radar.

Custom-designed T cells engineered to seek out the CD 19 + B-ALL cells in the body. These specialized T cells can target the B cell leukemia, attach to its CD19 protein and then kill off the leukemia cell.





LLS funded research

Clinical Update of Pediatric and Adult ALL Patients treated with CART19

5 Children
- -Refractory or 3rd+ Relapse
- -3 to 8+ prior therapies
- -4 with prior all BMT
- • 4 CR, 3 A&W up to 1 year out
- •1 relapsed with CD 19 (-) leukemia
- Now Infusing 2-3/month (over 16 total)

•1 Adult
- •1 CR

Barrett, D et al. AACR 2013

Take Home Message

1) We are curing more and more children with ALL
2) Conventional chemotherapy is not going to make much more of a difference
3) Targeted therapy is much more specific and often less toxic
4) Todays experimental therapy (Phase 1) is tomorrows cure
5) Adolescents and Young adults should be treated like Children (when it comes to ALL)

Side Effects of Treatment

- Can occur after chemotherapy, radiation therapy, or supportive care therapy
- Type of cancer, its location and age of the child will affect the severity of the side effects
- Side effects can encompass all body symptoms

LEUKEMIA & LYMPHOMA SOCIETY®
fighting blood cancers

someday is today

LLS has top notch resources

CureSearch® for Children's Cancer

- Curesearch.org is a also a great pediatric reference for parents and families newly diagnosed, in treatment, at the end of treatment and after treatment

Most common side effects of ALL treatment

- Hair loss
- Bone marrow suppression
- Impairment of the immune system
- Central nervous system complications
- Musculoskeletal complications
- Gastrointestinal complications
- Growth and development
- Pain

Hair Loss

- Also called alopecia
- Some chemotherapy causes loss or thinning of hair
- Typically starts 14 days after treatment is started
- Hair grows back when treatment is finished or treatment becomes less intensive

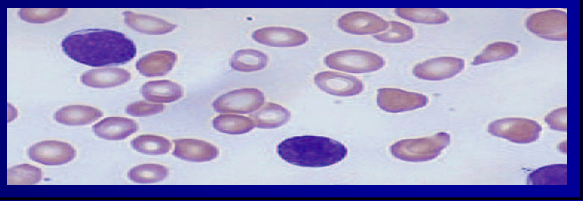
Side Effects of Treatment

- Bone marrow suppression
  - Most common dose-limiting component of cancer therapy
  - Bone marrow provides environment for formation of red blood cells, white blood cells and platelets

Bone marrow suppression

Anemia

- Also means low red blood cell count
- Red blood cells carry oxygen throughout the body
- May cause shortness of breath, headache, feeling tired, fast heart rate, pale skin



Bone marrow suppression

Thrombocytopenia

- Also means low platelet count
- Platelets stop bleeding by forming clots
- Risk of bleeding when platelet count is low
- Signs of low platelets: bruising or petechiae, bleeding, black stools

Bone Marrow Suppression

Neutropenia

- Reduction in circulating neutrophils
- Absolute Neutrophil Count (ANC)
- Severity can be mild, moderate or severe
- Can be asymptomatic, fevers can occur
- Increases risk for serious infection, risk increases with prolonged neutropenia

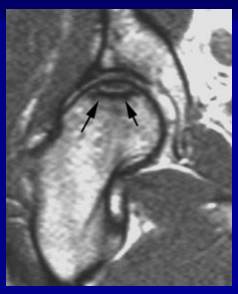
Side Effects of Treatment

- Impairment of the immune system
  - Increased risk for infection
  - PCP prophylaxis- bactrim, pentamidine, atovaquone
  - Routine immunizations are held during treatment and for a time after therapy has ended
  - Yearly Flu vaccine recommended

Central Nervous System

- Central nervous system complications
  - Cognitive deficits
  - Behavioral changes
  - Neuropathic pain, Flat Footed Gait
- Rare
  - Seizure
  - Stroke
  - Change in Mental Status

Musculoskeletal Concerns



- Steroid Myopathy
- Weakness
- Osteonecrosis
- Osteopenia
- Increased risk of Bone Fractures
- Pain at bone marrow sites

Gastrointestinal

- Mucositis
- Nausea/vomiting
- Diarrhea/constipation
- Perirectal cellulitis
- Chemical or reactive hepatitis
- Pancreatitis
- Veno-occulsive disease

Side Effects of Treatment

- Growth and development
  - Monitor throughout treatment
  - Intervene early
- Pain
  - Can be acute and/or chronic
  - May be from disease and/or treatment
  - Treat underlying cause of pain
  - Pharmacologic and non-pharmacologic treatment of pain

Psychosocial Effects

- Fear
  - Fear of unknown
  - Treatment and procedures
- Guilt
  - Parents often feel guilty for not knowing that their child was sick
  - Siblings may feel guilty that they are healthy
  - Something they did caused this

LLS Care for the Caregivers

Psychosocial Effects

- Anger
  - Feeling angry is a normal reaction
  - Steroid behavior
- Depression
  - Feeling sad or blue is normal reaction to diagnosis and treatment
  - The changes in family routine may bring feelings of social isolation and loss

No Stigma for seeking therapy/support

Quality of life (QOL)

- Numerous studies on treatment of ALL and QOL
  - QOL impaired during treatment
  - QOL can be affected both on therapy and after therapy
  - Children/adolescents with ALL have decreased QOL when compared to norms

Survivorship

- Patients should be followed annually, even when years off therapy
- Late effects need to be screened
  - Cardiovascular
  - Growth/ Development
  - School Performance
  - Liver and renal function
  - Radiation field second cancer screen
